

Non Functional Requirements

Performance

The application should provide responses suitable for real-time web interaction.

Usability

The interface should be simple and easy to use.

Reliability

The application should process user information and generate responses correctly.

Maintainability

The application should use separate modules for routing, AI generation, database operations and frontend templates.

Scalability

The application should be structured so that additional functionality can be added later.

Security

Sensitive information such as the Gemini API key should be stored using environment variables rather than directly inside source code.
